

## **WEATHERWATCH SERVICE**

WeatherWatch Service provides highly accurate location specific measurements. WeatherWatch Service uses the latest in weather technology with many weather products from the National Weather Service along with worldwide data services. Their staff of meteorologists has immediate access to available weather observations that are taken hourly, at a minimum, over most of the world.

WeatherWatch provides forensic measurements by monitoring Doppler radar data showing the storm track and intensity for precipitation in various forms: they use satellite imagery and live weather radar pointed at your specific event location (Street, City, State, & Zip Code) or where necessary other recognized weather measurement methodologies. WeatherWatch's trained meteorologists will apply their expert interpretation to the data they obtain to provide a recording of the weather relevant to the Insured Weather Peril of your insurance policy. WeatherWatch can record rainfall, snowfall, temperatures, and other measurable weather occurrences.

WeatherWatch has been in business for more than 15 years with Chief Meteorologist and President Tim Root's individual 32 years of weather experience.
